METHOD AND DEVICE FOR THERMALLY TREATING FLOUR
FOR HYGIENIC PURPOSES

This invention relates to a method and device for thermally treating flour and similar free-flowing food and feed products according to the definition of the species of claim 1 as well as a device for carrying out this method. In particular, this invention relates to the thermal treatment of feed meal and flour.

Methods are known for hygienic treatment or sterilization of pellets or powdery substances that are used as human and/or animal feed products. This requires an adequate thermal and/or hydrothermal treatment to kill or at least inactivate microorganisms. This treatment is followed by cooling. In a continuous operation, this results in different holding times and uneven conditions at the beginning and end of the treatment operation.

International Patent W098/43682 concerns a batch method of sterilizing granules and the like, where the product is heated to a sterilization temperature by means of steam in a chamber of a mixing apparatus. After this heating, the product goes to a second chamber beneath that, where it is subject to a holding time until it is discharged. The heat treatment of the product takes place with the product in a fluidized state. The two chambers are separated from one another by means of closable discharge openings. The volume of the second chamber is larger than the volume of the first chamber.

According to European Patent B 219,471, the mixing unit consists of a mixing chamber with rotating mixing paddles and a misting device in the form of a rotating line roller.

- 2 -

According to European Patent B 210,966, such a mixer may also have means for lateral feed of a cooling agent or a drying agent.

In addition, it can also be regarded as known to provide such units with additional cooling and drying equipment, where the suggested solutions have been based on rigid and thus inflexible combinations because in most cases continuous operation of large quantities of product is assumed. The above-mentioned types of equipment usually have long inclinations and transitions, which can lead to conveyance problems and temperature differences.

The object of this invention is to develop a method of thermal treatment of flour and meal for hygienic purposes, especially for thermal treatment of feed meal which will avoid the disadvantages of the state of the art and will also permit efficient treatment of even small batches. This object is achieved with the characterizing features of claim 1.

Another object of this invention is create a device for thermal treatment of flour, especially feed meal according to claim 4, for hygienic purposes.

Advantageous embodiments are disclosed in the respective subordinate claims.

The basic idea of this invention consists of first performing a thermal treatment, e.g., of feed meal in a mixer, preferably a batch mixer, at first in accordance with the state of the art, and then drying and cooling the treated product and only then adding sensitive additives to the batch in a subsequent mixer, where they are incorporated.

This not only allows an adaptation to different batch sizes but also avoids the problem of condensation and prevents damage to the additives during the thermal treatment. The latter also makes it possible to add smaller amounts of additives such as antibiotics. The equipment used for this may be set up in a modular fashion, permitting a great variation in designs.

The method according to this invention permits a very short set-up time, rapid product changes and reliable thermal conditions without the risk of condensation, thus eliminating a significant source of contamination.

This invention will be described in greater detail below in an embodiment on the basis of a drawing. In the drawing, the only figure shows a schematic diagram of a device for thermal treatment of feed meal for hygienic purposes.

This device has a depot 1 which is filled with the product to be treated (feed meal). The depot 1 is connected to a mixer 4 by a flap valve system 3, where the flap valve system 3 permits an airtight separation between the depot 1 and the mixer 4.

The mixer 4 is a batch mixer, preferably designed according to Swiss Patent 1333/94 or European Patent A 685,255 and having a mixer shaft 1 with mixing paddles as well as a device for steam feed 6.

The product outlet 7 of the mixer 4 is connected to a dryer/cooler 8 which is equipped with a filter 9 for exhaust air purification. Likewise, a heating register 10 is also provided. Both hot air for drying the product and cool air can be generated.

The dryer/cooler 8 is connected by another valve system

- 4 -

11 to another batch mixer 12 which is designed like batch mixer 4. A discharge device such as a discharge screw 13 is provided at the product outlet of the batch mixer 12 for discharging the treated feed meal 2'.

The batch mixer 12 also has a device 14 for adding solid or liquid substances which are sensitive to heat; this device has nozzle bars. Such devices are described in German Patent Application P19904994.7 by the present applicant, which was not published previously, and they may also include small component scales or the like.

To increase the capacity of the device, the dryer/cooler 8' and/or batch mixer 12' may also be connected in parallel.

The batch mixer 4 also has a heater 15, and the entire system can be sterilized with hot air through a corresponding heating management 16 or it can be cleaned with cool air. This guarantees a high level of cleanliness, short cleaning times and rapid product change. The parts of the device which come in contact with product have inclined surfaces which thus tend to collect less dirt (at the same time, they also yield the lowest risk of entrainment).

The feed meal 2 to be treated goes first into depot 1 and then goes through the lock-like valve system 3 in to the batch mixer 4, where the product 2 is heated, which is accelerated by thorough mixing of the product 2 by mixing paddles on the mixer shaft 5 (short dwell time), thus yielding a high degree of uniformity in conditioning. The resulting heating temperature to be set depends on the desired degree of sterility as well as other factors.

Due to the subsequent drying and cooling in a separate

- 5 -

dryer/cooler 8, not only is condensation largely prevented but also the next batch can already be treated in batch mixer 4. Corresponding closing devices (not shown) are provided between the individual components.

Product dust goes to the filter 9, and the purified exhaust air can be discharged to the environment or it can be reused in circulating air. This process is controlled in such a way that the resulting filtered dust is returned to the processed batch of product feed meal 2 without any risk of entrainment.

Then any required additives are added to the cooled and dried product 2' in batch mixer 12, and then the product is discharged by means of the discharge screw 13.
